Field of the Invention The present invention relates to data processing and, in particular, to mechanisms for handling overflow and underflow situations, 2. Description of the Prior Art Data processing systems (e.g., microprocessor-based systems) are becoming increasingly more complex. As the complexity of such systems increases, overflow and underflow situations can occur. Such situations may occur in a variety of different contexts. For example, a data processing system may perform a particular calculation or sequence of calculations and during such calculation a calculation result exceeds a maximum value or a minimum value of the system. When such an overflow or underflow situation occurs, the result of the calculation is "wrap around" to the larger or smaller value and "wrap-around" to a larger or smaller value. Such a wrap-around effect is illustrated in FIG. 1. It is possible that a data processing system can "detect" or "notify" of an overflow or underflow situation and that such detection or notification can be done with high performance in such a system. For example, a data processing system may be designed to recognize the value of a floating point calculation result and to notify the user of an overflow or underflow situation. In other situations, a data processing system may perform a floating point calculation and, during the calculation, not be able to determine whether the result of the calculation will be an underflow or overflow situation. For example, a data processing system may perform a floating point calculation that is expected to result in a value that is an integer. However, the actual result of the floating point calculation may result in a value that is a decimal number or a non-integer. Thus, a need exists for an improved data processing system for detecting and/or handling an overflow and/or underflow situation.Cough and voice disorders in asthma. There are several cough variants that occur in association with asthma. These cough variants are differentiated as follows. Type A 82157476af
